November 1959

NEW BUTTERFAT TEST APPROVED FOR USE IN DHIA PROGRAM

For several years the ADSA Records Committee has reviewed research on the accuracy and practicability for field use of various detergent butterfat tests.

Based on research reviews by the Committee at the 1959 annual meeting of the American Dairy Science Association, the Committee determined that the TeSa Butterfat Test (a modified detergent test) was sufficiently acceptable to meet the requirements for use in dairy production record-keeping programs.

The American Dairy Science Association approved the TeSa Test for use in dairy production record-keeping programs subject to the Association of Official Agricultural Chemists (AOAC) specific approval of the test for such use.

Mr. Ralph Bonewitz, Chairman of the 1960 ADSA Records Committee, submitted to the AOAC data and research studies for the AOAC's evaluation of the TeSa Test.

In a letter dated November 9, 1959, to Mr. Ralph Bonewitz, Dr. William Horwitz, Secretary-Treasurer of AOAC, writes in reference to the TeSa Test as follows:

"---The Association adopted as first action the detergent test (TeSa) as a rapid method for the determination of fat in raw milk."

Therefore, the TeSa Butterfat Test has been approved by the ADSA and the AOAC for use in dairy production record-keeping programs.

Inquiries in each State relative to the use of the Test in DHIA, OS, and WAD programs should be addressed to the State Extension Dairyman of that State.

DHIA PROVED-SIRE RECORDS TABULATED IN OCTOBER 1959

Following is a list of 304 sires whose records were tabulated or retabulated by the Animal Husbandry Research Division in October 1959. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
